

Software

With SMARTair™ TS1000 software, the facilities manager can manage access rights using calendar schedules for different user groups. The system offers ongoing flexibility: new doors, new users and new access rights. Schedules can easily be incorporated at any time.

Card encoder

- Offers read and write functionality: via the credential the events can be collected and the modifications in the user's locking plan can be loaded in the lock

Programming device (portable):

- Transfer of information from the locking plan to the door
- Update door, transmitting the modifications made in the locking plan
- Open door in an emergency (batteries failed)
- Optional USB+Laptop to update

Credentials

- Available as cards, tags or bracelets for contactless identification
- Encrypted credentials are available in various secure RFID technologies – HID iCLASS® and MIFARE Classic or DESFire
- Cards can be customized with card printers

Similar to a master key management system, the software offers time limited access for each user, as well as the ability to easily change access rights.
